

SE Global Outreach Operations Manual

Version 1.0

1. Purpose

This system manages lead upload, website and email enrichment, personalized drafting, controlled sending, and weekly performance reporting.

2. Starting the dashboard

From the project folder run: `streamlit run operations_dashboard.py`. Open the local URL shown by Streamlit. The dashboard uses `outreach.db` and writes run details to `logs/dashboard_run.log`.

3. Preparing credentials

Put SMTP, IMAP, Groq, and WhatsApp settings in the local `.env` file. Use `DRY_RUN=true` for testing. Set `DRY_RUN=false` only after reviewing a batch and confirming live delivery.

4. Uploading leads

Upload a CSV containing website or email. Optional columns include `company`, `first_name`, `last_name`, and `phone`. The dashboard limits each saved run to the selected daily batch size, up to 70 leads.

5. Running automation

Save the CSV, select dry-run or live mode, and start automation. The workflow loads leads, scrapes websites, uses supplied emails when present, drafts with Groq when available, falls back safely when unavailable, sends eligible emails, and generates report files.

6. Monitoring

The status cards show total, new, scraped, sent, and simulated sends. The pipeline chart and lead table show current database state. The run log shows scraper, Groq, SMTP, and report events. Refresh the page to update the view.

7. Weekly reports

Each full run produces `weekly_report.csv` and `weekly_report.html` with lead, scrape, draft, send, reply, follow-up, and sentiment statistics.

8. Safety checklist

Start with `DRY_RUN=true`. Review the selected CSV. Confirm the daily batch size. Verify the SMTP sender identity and selected recipients. Only then enable live mode.

9. Useful commands

```
python src/main.py --mode full --csv path\to\leads.csv
streamlit run operations_dashboard.py
```
